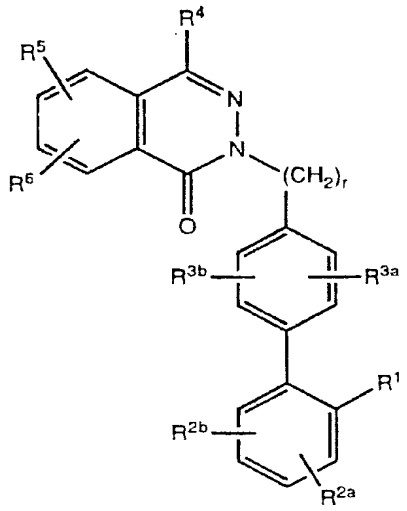
TITLE OF THE INVENTION

SUBSTITUTED PHTHALAZINONES AS NEUROTENSIN ANTAGONISTS

INTRODUCTION OF THE INVENTION

This invention relates to novel substituted phthalazinone compounds represented by formula I:



which are antagonists of peptide hormone neurotensin. The invention is also concerned with the use of aforementioned neurotensin antagonists in the treatment of states meditated by neurotensin.

BACKGROUND OF THE INVENTION

Neurotensin (NT) is a tridecapeptide hormone (pGlu-Leu-Tyr-Glu-Asn-Lys-Pro-Arg-Arg-Pro-Tyr-Ile-Leu-OH), originally isolated from the bovine hypothalamus [Carraway, R. and Leeman, S. E., J. Biol. Chem., **248**, 6854 (1973)], has subsequently been shown to be distributed in the brain [Uhl, G. R., et al., Proc. Natl. Acad. Sci. USA, **74**, 4059-4063 (1977)], gastrointestinal tract [1). Kitabgi, P., Carraway, R. and Leeman, S. E., J. Biol. Chem., **251**, 7053 (1976); 2). Carraway, R., Kitabgi, P., and Leeman, S. E., J. Biol. Chem., **253**, 7996 (1978); 3).Helmstadler, V., Taugner, C., Feurle, G. E. and Frossman, W. G., Histochemistry, **53**, 35-41 (1977)] and pancreas [Feurle, G. E. and Niestroj, S., Pancreas, **6**, 202-207 (1991) and references cited therein] of various animals including human [Mai, J. K., et al., Neuroscience, **22**, 499-524 (1987)]. Although the physiological role of neurotensin has not yet been clearly understood, this endogenous peptide participates in a wide spectrum of central [1). Prange, A. J. and Nemeroff, C. B., Annal. NY Acad. Sciences, **400**, 368-375 (1982); 2). Stowe, Z. N.and Nemeroff, C. B., Life Sci., **49**, 987-1002, (1991); 3) Kitabgi, P., Neurochem. Int., **14**, 111-119 (1989); 4). Levant and Nemeroff, C. B., Current topics in Neuroendocrinology, **8**, 231-262 (1988)] and peripheral [Leeman, S. E., Aronin, N. and Ferris, C., Hormone Res., **38**, 93-132 (1982)] biological functions.

Neurotensin is also known to release mast cell histamine, indicating that antagonists will be useful in the treatment of allergic and inflammatory conditions, as well. [See, Rossei, S.S. and Miller, R.J., Life Sci., 31, 509-516 (1982) and Kurose, M. and Saeki, K., Eur. J. Pharmacol., 76, 129-136 (1981).]

Neurotensin, like most other peptides, is unable to cross the blood-brain barrier (BBB). However, certain peripheral effects of neurotensin have been observed after central administration of the peptide [Prange, A. J. and Nemeroff, C. B., Annal. NY Acad. Sciences, **400**, 368-391 (1982)]. The direct application of neurotensin into the brain causes hypothermia, potentiation of barbiturate induced sedation, catalepsy, antinociception, blockade of psychostimulant-induced

locomotor activity and reduced food consumption. In the central nervous system (CNS), neurotensin behaves as a neurotransmitter or neuromodulator [1) Uhl, G. R. and Snyder, S. H., Eur. J. Pharmacol., **41**, 89-91 (1977); 2) Uhl, G. R., Annal. NY Acad. Sciences, **400**, 132-149 (1982)], and has been shown to have close anatomical and biochemical associations with the dopaminergic (DA) system [Nemeroff, C. B., et al. Annal. NY Acad. Sciences, **400**, 330-344 (1982)]. Neurotensin increases the synthesis and the turnover of DA in rat brain. Acute and chronic treatment with clinically efficacious antipsychotic drugs (e.g., haloperidol, chloropromazine) have consistently demonstrated an increase in neurotensin concentrations in the nucleus accumbens and striatum while phenothiazines that are not antipsychotics did not produce this increase. Behaviorally, neurotensin, after central administration, mimics the effects of systemically administered neuroleptics. However, unlike classical neuroleptics (which primarily acts on D_2 receptors), neurotensin fails to bind to dopamine receptors or inhibit cAMP accumulation following DA receptor activation. Neurotensin does not block the stereotypy induced by DA agonists. The post-mortem studies of patients with schizophrenia showed an increase in the level of neurotensin in the Brodman's area 32 of human brain [Nemeroff, C. B., et. al., Science., **221**, 972-975 (1983) and references cited therein], which suggest possible roles of neurotensin in the pathophysiology of this disease. Neurotensin receptors have also been implicated in Parkinson's disease and progressive supranuclear palsy [Chinaglia, G. et al., Neuroscience, **39**, 351-360 (1990)].

Of the total body neurotensin in many mammalian species, more than 80% is present in the gastrointestinal tract, especially in the distal small intestine in the endocrine like N-cells. In the gut, neurotensin stimulates pancreatic secretion [Sakamoto, T.,et al, Surgery, **96**, 146-53 (1984)], inhibits gastric acid secretion and gastric emptying [Blackburn, A. M., Lancet, **1**, 987-989 (1980)]. Neurotensin also stimulates the growth of small intestinal mucosa in an isolated defunctional loop of jejunum, which suggests a direct systemic effect of neurotensin in the gut. In addition, neurotensin can stimulate pancreatic

exocrine secretion in mammals [Iwatsuki, K., et al., Clin. Expt. Pharmacol. Physiol., **18**, 475-481 (1991) and references cited therein].

From the structural work, it is evident that the biological activity of neurotensin resides within the carboxy terminal five or six amino acid residues. The C-terminal hexapeptide NT^{8-13} has displayed full biological activity of the tridecapeptide. In contrast, all amino terminal partial sequences are essentially inactive [Leeman, S. E. and Carraway, R. E., Annal. NY Acad. Sciences, **400**, 1-16 (1982)]. The C-terminal COOH group and two Arg residues are essential for the biological activity of NT^{8-13} as well as neurotensin. L-amino acids are required at positions-9,10,11 and 13, and only Arg^8 can be replaced by D-Arg without loss of any activity. At the position-11, an aromatic amino acid is essential. Similarly, alkyl side-chains of Ile^{12} and Leu^{13} are also necessary for full biological activity [Kitabgi, P., Annal. NY Acad. Sciences, **400**, 37-53 (1982)]. Most of the analogues of neurotensin examined generally behaved as agonists. However, two analogues D-Trp^{11}-NT and Tyr(Me)^{11}-NT have displayed partial antagonist activity [Rioux, F. R.,et al., Eur. J. Pharmacol., **66**, 373-379 (1980)].

Although there are reports of peptidic neurotensin antagonists, none are clinically useful, due to their short biological half life and limited oral bioavailability.

A European Patent Application, EP 477,049, disclosing 3-carboxamido-1,2-pyrazoles as non-peptidic neurotensin antagonists recently published.

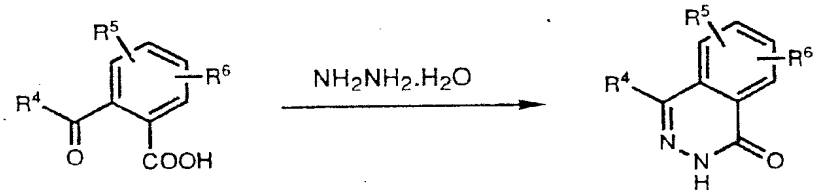
The terms "alkyl", "alkenyl", "alkynyl": and the like include both the straight chain and branched chain species of these generic terms wherein the number of carbon atoms in the species permit. Unless otherwise noted, the specific names for these generic terms shall mean the straight chain species. For example, the term "butyl" shall mean the normal butyl substituent, n-butyl.

For a general review of synthesis and reactivity of substituted phthalazinones and related compounds, see - M. Tishler and B. Stanovnik, Comprehensive Heterocyclic Chemistry, Vol. 3 (part 2B), 1-56 (1984) Eds: A. J. Boulton and A. Mckillop; Pergamon Press., and also N. R. Patel, Heterocyclic Compounds, Vol. 27, Chapter II, pages 376-446 (1973). Ed: R. N Castle, John Wiley & Sons, and references cited therein.

Scheme 1 illustrates the preferred method for the preparation of substituted phthalazin-1-(2H)-ones. An appropriately substituted 2-acylbenzoic acid 1 or a similar starting material is reacted with hydrazine hydrate in an appropriate solvent such as an alcohol or acetic acid under reflux for 2-24 h to form the corresponding substituted phthalazin-1-(2H)-one 2.

Scheme 1



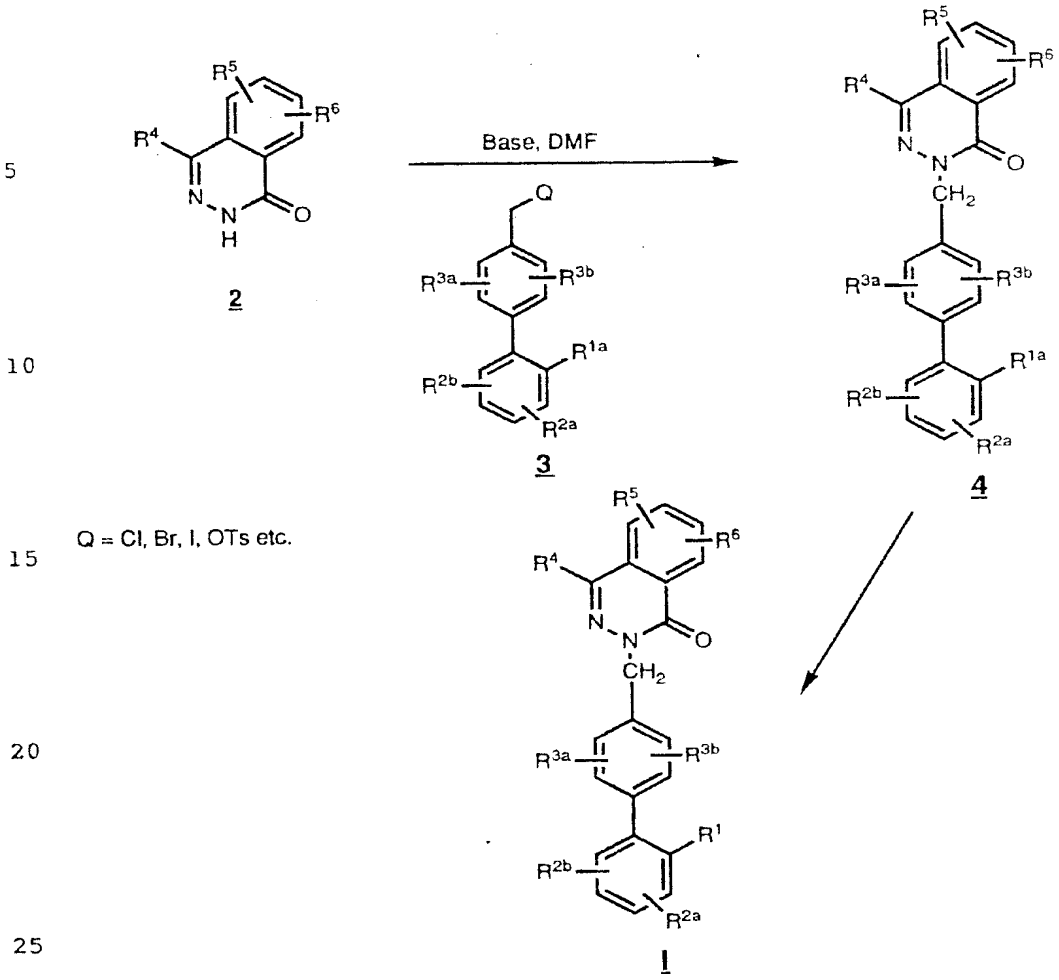
1 2

Where R^4 is H, alkyl or aryl, as defined before.

The keto acid 1 may be prepared from the appropriately substituted 2-bromobenzoic acid or a similar starting material using the methods described in the literature [W. E. Parham, C. K. Bradsher, K. J. Edger, J. Org. Chem., **46**(6), 1057(1981) and references cited therein]. Alternatively, the keto acids may also be synthesized by procedures described by R. L. Shriner et al., J. Org. Chem., **16**, 1064 (1951), and C. R. Hauser et al., J. Org. Chem., **23**, 861 (1958).

A general method for the preparation of 2-alkyl-phthalazin-1-(2H)-ones of Formula I is illustrated in Scheme 2. An appropriately substituted phthalazin-1-(2H)-one 2 is alkylated with the appropriate alkyl halide 3 (or pseudo halide, such as tosylate, mesylate, triflate and the like) in the presence of an appropriate base such as alkali metal hydrides, carbonates, bicarbonates or an organic base (e.g., trialkylamines, morpholine and the like) in an appropriate polar solvent, such as dimethylformamide, dimethylsulfoxide, tetrahydrofuran, lower alkyl alcohols and the like. The alkylated material 4 may then be transformed into the desired compound of Formula I by removal of the protecting group present in R^{1a} followed by further transformation of the functional group, thus formed, into the desired R^1 group. Similarly, the R^{1a} may also be directly transformed into the desired R^1 to give the compound of formula I.

Scheme 2

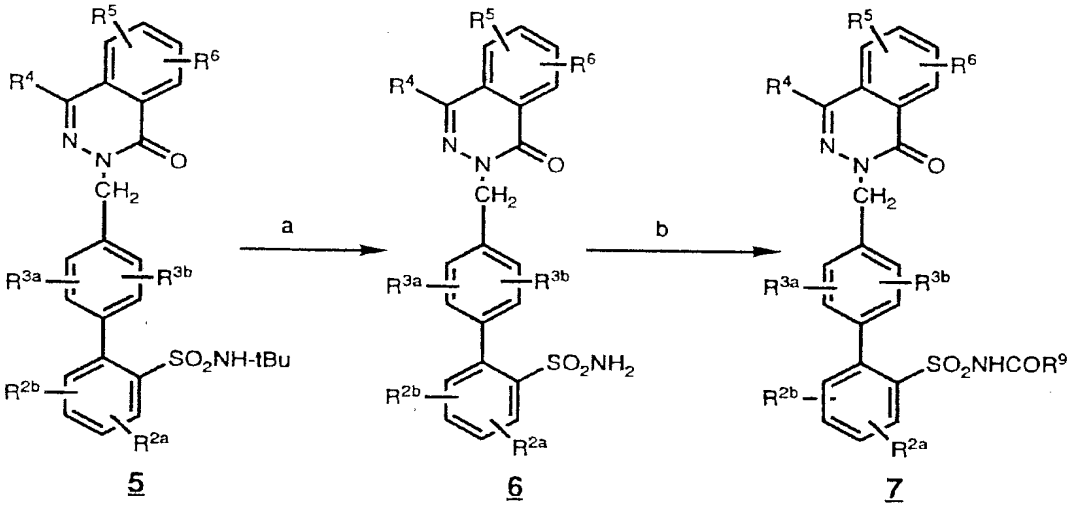


2 3 4 I

The biphenyl alkylating agents 3 can be synthesized using the reactions and techniques described in published US Patent No. 5,126,342 (Merck & Co, Inc.).

Compounds of Formula I in which R^1 is SO_2NHR^9 or SO_2NHCOR^9 may be prepared according to the general methods described for such transformations in US Patent 5,126,342. More specifically these compounds may be prepared as outlined in Scheme 3.

Scheme-3



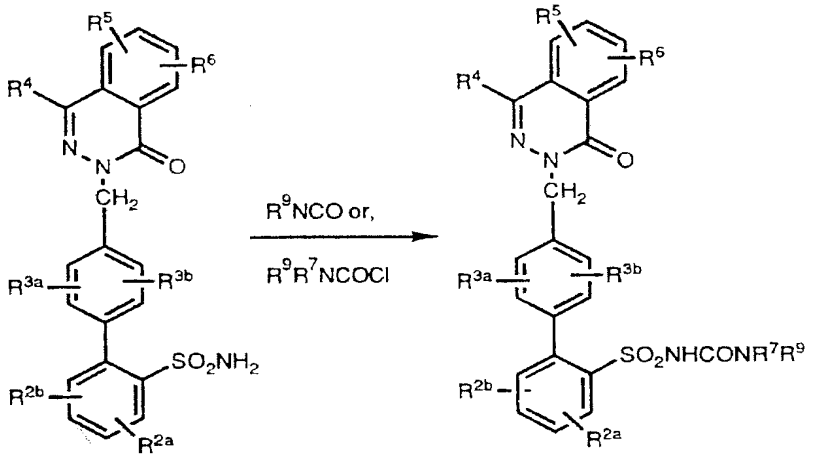
a. TFA, 25°C - reflux

b. R^9COOH, Carbonyldiimidazole, DBU

The protected sulfonamide 5 (prepared as described in Scheme 2 using the alkylating agent 3, where R^{1a} is -SO_2NH-tBu) is reacted with TFA, and the resulting free sulfonamide 6 is acylated with an appropriate acylimidazole (generated from the corresponding R^9COOH and carbonyldiimidazole) in the presence of DBU to form the acylsulfonamide 7.

Compounds of Formula I in which R^1 is $SO_2NHCOOR^9$ or $SO_2NHCONR^7R^9$ may be prepared according to methods outlined in Schemes 4 and 5.

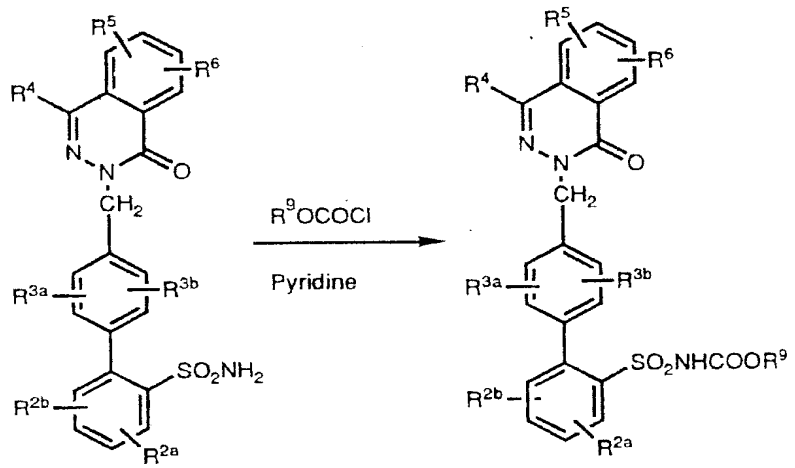
Scheme-4



6 8

The sulfonamide 6 may be reacted with an appropriate isocyanate (R^9NCO) or carbamoyl chloride (R^7R^9NCOCl) in the presence of an appropriate base to form the corresponding sulfonylureas 8.

Scheme-5



6 9

Similarly, the sulfonamide 6 may be reacted with an appropriate alkyl or aryl chloroformate (R^9OCOCl) in the presence of an appropriate base such as pyridine to form the corresponding sulfonylcarbamate 9.

Compounds of Formula I, where R^1 is $-NHSO_2NHCOR^9$ may be prepared from the corresponding nitro precursor 10 (prepared according to Scheme 2, where $R^{1a} = NO_2$) as outlined in Scheme 6. The nitro group in 10 is reduced to the corresponding amine 11 which may then be reacted with t-butylsulfamoyl chloride to give the N-t-butylsulfamide 12. Removal of the t-butyl group followed by acylation may produce the desired acylsulfamides 13. Similarly, compound 12 may be reacted with an appropriate N-acylsulfamoyl chloride to give 13.

The reactions are performed in a solvent appropriate to the reagents and materials employed and suitable for the transformation being effected. It is understood by those skilled in the art of organic synthesis that the functionality present on the heterocycle and in the reactants being employed should be consistent with the chemical transformations being conducted. Depending upon the reactions and techniques employed, optimal yields may require changing the order of synthetic steps or use of protecting groups followed by deprotection.

The compounds of this invention form salts with various inorganic and organic acids and bases which are also within the scope of the invention. Such salts include ammonium salts, alkali metal salts like sodium and potassium salts, alkaline earth metal salts like the calcium and magnesium salts, salts with organic bases; e.g., dicyclohexylamine salts, N-methyl-D-glutamine salts, salts with amino acids like arginine, lysine, and the like. Also, salts with organic and inorganic acids may be prepared; e.g., HCl, HBr, H_2SO_4, H_3PO_4, methanesulfonic, toluenesulfonic, maleic, fumaric, camphorsulfonic. The nontoxic, physiologically, acceptable salts are preferred, although other salts are also useful in isolating and/or purifying the product.

The salts can be formed by conventional means, such as by reacting the free acid or free base forms of the product with one or more equivalents of the appropriate base or acid in a solvent or medium in which the salt is insoluble, or in a solvent such as water which is then removed in vacuo or by freeze-drying or by exchanging the cations of an existing salt for another cation on a suitable ion exchange resin.

Neurotensin is a peptide hormone and the assays described below have been developed to identify neurotensin antagonists and to determine their efficacy in vitro. The following three assays have been employed for that purpose.

RAT FOREBRAIN RECEPTOR ASSAY

Male rats are sacrificed by decapitation following ether anesthetization. Forebrains are homogenized using a polytron in 20 volumes 50 mM Tris HCl, pH 7.4, and centrifuged at 50,000 x g for 20 min. The final pellet is washed twice by rehomogenization and centrifugation as before. The final pellet is resuspended at a concentration of 8 mg tissue (wet weight) per 0.750 ml of 50 mM Tris HCl, pH 7.4, which also contains 1 mM EDTA, 4 mg/ml bacitracin, 5 mM levocabastine HCl, 1mM phenanthroline, 10 mg/ml soybean trypsin inhibitor and 100 mM phenyl methyl sulfonyl fluoride. Assay tubes (13 X 100 mm polypropylene) receive 1) 100 µl buffer or 10 mM neurotensin (for non-specific binding) 2) 100 µl of 60 pM [^{125}I]neurotensin 3) 20 µl test compounds 4) 750 µl tissue suspension and 5) enough buffer to bring final volume to 1 ml. After 30 minutes at room temp, the samples are filtered using a Brandel M24 cell harvestor with GF/B filtermats that have been presoaked in 0.2% polyethyleneimine for 2 hours. The tubes are rinsed with 3 X 4 ml of ice cold 10 mM Tris buffer (pH 7.4 at room temperature). The filter discs are placed in 12 X 75 mm polypropylene tubes for counting on a Packard Multi-Prias gamma counter.

HUMAN HT-29 CELL MEMBRANE ASSAY

HT-29 cells were routinely grown in 225 cm^2 Costar tissue culture flasks at 37°C in a humidified atmosphere of 5% CO_2/95% air in Dulbecco's modified Eagle's medium with high glucose containing 50 U/ml penicillin, 50 mg/ml streptomycin, 5% fetal bovine serum and 5% newborn calf serum. Cells were subcultured with 0.25% trypsin at a ratio of 1:6 with confluence being reached at 48 to 72 hrs. Cells from confluent flasks (approx. 1 x 10^8 cells/flask) were harvested by scraping. The cells were pelleted by centrifugation (1000 x g, 5 min), resuspended in 50 mM Tris HCl, pH 7.4, and homogenized with a polytron (setting 7 for 10 sec.). Cell membranes were washed twice by centrifugation (50,000 x g, 15 min) and rehomogenized. The resulting pellet was either frozen at -70°C for future use or run directly in the

assay by resuspending at a concentration of 0.5 x 10^6 cells per 0.750 ml of assay buffer (50 mM Tris HCl, pH 7.4, containing 1 mM EDTA, 40 mg/ml bacitracin, 1 mM phenanthroline, 10 mg/ml soybean trypsin inhibitor and 100 mM phenylmethylsulfonyl fluoride).

Assay tubes (13 x 100 mm polypropylene) receive 1) 100 µl buffer or 10 mM neurotensin (for non-specific binding) 2) 100 µl of 60 pM [^{125}I]neurotensin 3) 20 µl test compounds 4) 750 µl cell membrane suspension and 5) enough buffer to bring final volume to 1 ml. After 30 minutes at room temperature, the samples are filtered using a Brandel M24 cell harvestor with GF/B filtermats that have been presoaked in 0.2% polyethyleneimine for 2 hours. The tubes are rinsed with 3 x 4 ml of ice cold 10 mM Tris buffer (pH 7.4 at room temperature). The filter discs are placed in 12 x 75 mm polypropylene tubes for counting on a Packard Multi-Prias gamma counter. [The above assay is derived from the assay described in Kitabgi, P. et al., Molecular Pharmacology, 18, 11-19 (1980)].

NEUROTENSIN BINDING ASSAY TO HUMAN FRONTAL CORTEX

Post-mortem human brain is obtained through the National Disease Research Interchange (Philadelphia, PA). The donors were without psychiatric or neurological abnormalities. Frontal cortex is dissected free of white matter and homogenized using a polytron in 20 volumes 50 mM Tris HC1, pH 7.4, and centrifuged at 50,000 x g for 20 min. The resulting pellet is washed twice by rehomogenization and centrifugation as before. The final pellet is resuspended at a concentration of 8 mg tissue (wet weight) per 0.750 ml of 50 mM Tris HC1, pH 7.4, which also contains 1 mM EDTA, 4 mg/ml bacitracin, 1 mM phenanthroline, 10 mg/ml soybean trypsin inhibitor and 100 mM phenyl methyl sulfonyl fluoride. Assay tubes (13 x 100 mm polypropylene) receive 1) 100 µl buffer or 10 mM neurotensin (for non-specific binding) 2) 100 µl of 60 pM [^{125}I]neurotensin 3) 20 µl test compounds 4) 750 µl tissue suspension and 5) enough buffer to bring final volume to 1 ml. After 30 minutes at room temp, the samples are filtered using a Brandel M24 cell harvestor with GF/B

filtermats that have been presoaked in 0.2% polyethyleneimine for 2 hours. The tubes are rinsed with 3 x 4 ml of ice cold 10mM Tris buffer (pH 7.4 at room temperature). The filter discs are placed in 12 x 75 mm polypropylene tubes for counting on a Packard Multi-Prias gamma counter.

Using the methodology described above, representative compounds of the invention were evaluated and all were found to exhibit an activity of at least IC_{50}<50μM thereby demonstrating and confirming the utility of the compounds of the invention as effective neurotensin antagonists.

Thus, the compounds of the present invention are useful in attenuating the effect of peptide hormone neurotensin, and hence in the treatment of conditions that are caused by altered levels of neurotensin in humans. These compounds are of value in the treatment of a variety of central nervous system disorders, such as psychoses, depression, Alzheimer's disease and anxiety. These compounds may also be expected to be useful in the treatment of gastrointestinal disorders such as gastroesophageal reflux disorder (GERD), irritable bowel syndrome, diarrhea, cholic, ulcer, GI tumors, dyspepsia, pancreatitis and esophagitis.

About 1 to 100 mg. of compound or mixture of compounds of Formula I or a physiologically acceptable salt is compounded with a physiologically acceptable vehicle, carrier, excipient, binder, preservative, stabilizer, flavor, etc., in a unit dosage form as called for by accepted pharmaceutical practice. The amount of active substance in these compositions or preparations is such that a suitable dosage in the range indicated is obtained.

Illustrative of the adjuvants which can be incorporated in tablets, capsules and the like are the following: a binder such as gum tragacanth, acacia, corn starch or gelatin; an excipient such as microcrystalline cellulose; a disintegrating agent such as corn starch, pregelatinized starch, alginic acid and the like; a lubricant such as magnesium stearate; a sweetening agent such as sucrose, lactose or saccharin; a flavoring agent such as peppermint, oil of wintergreen or cherry. When the unit dosage unitform is a capsule, it may contain, in

addition to materials of the above type, a liquid carrier such as fatty oil. Various other materials may be present as coatings or to otherwise modify the physical form of the dosage unit. For instance, tablets may be coated with shellac, sugar or both. A syrup or elixir may contain the active compound, sucrose as a sweetening agent, methyl and propyl parabens as preservatives, a dye and a flavoring such as cherry or orange flavor.

Sterile compositions for injection can be formulated according to conventional pharmaceutical practice by dissolving or suspending the active substance in a vehicle such as water for injection, a naturally occurring vegetable oil like sesame oil, coconut oil, peanut oil, cottonseed oil, etc., or a synthetic fatty vehicle like ethyl oleate or the like. Buffers, preservatives, antioxidants and the like can be incorporated as required.

The following examples illustrate the preparation of the compounds of formula (I) and their incorporation into pharmaceutical compositions and as such are not to be considered as limiting the invention set forth in the claims appended hereto.

All ^{1}H-NMR spectra were recorded on a Varian XL-200 or XL-400 Fourier Transform spectrometer. Chemical shifts are reported as (parts per million) downfield from tetramethylsilane. Mass spectra were obtained from the Merck & Co, Inc. mass spectral facilitiy in Rahway, N.J.. Analytical TLC was conducted on E. M. Merck precoated silica plates (0.25 mm on glass, Kieselgel 60 F254) with UV and/or iodine visualization. Flash chromatography was conducted using E. Merck silica gel (mesh 200-400). All reactions were carried out under an atmosphere of dry nitrogen under standard conditions unless specified otherwise.

EXAMPLE 1

SYNTHESIS OF PHTHALAZIN-1(2H)-ONES: (A GENERAL DESCRIPTION):

To a suspension or a solution of an appropriate 2-acylbenzoic acid (available from a commercial source or prepared according to the literature procedure cited earlier)(1 mMol) in ethanol (5 ml) was added hydrazine hydrate (5 mMol), and the resulting mixture was refluxed for 2-6 h. The reaction was cooled to room temperature, and the solid precipitated was filtered, washed with water and then cold ethanol. The resulting solid was dried in vacuo to give the desired phthalazin-1-(2H)-one which was crystallized from ethanol or any other appropriate solvent. Alternatively, the reaction mixture was concentrated to give the crude product which was then purified by trituration with water followed by crystallization from an appropriate solvent to give the desired phthalazin-1-(2H)-one.

Table II lists representative examples of phthalazin-1(2H)-ones prepared according to the procedure outlined in Example 1.

EXAMPLE 2

Preparation of 4-p-toluyl-2-(2'-aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one.

Step 1. 4-p-toluyl-2-(2'-t-butylaminosulfonyl)-biphen-4-yl)methyl-phthalazin-1-(2H)-one (Alkylation of substituted phthalazin-1-(2H)-one)

To a suspension of 4-p-toluyl-phthalazin-1-(2H)-one [compound 2D] (2.36 g, 10 mMol) in toluene (50 mL) were added 2.5 N aqueous NaOH (4 mL) and Triton B (1 mL) followed by 2-(4'-bromomethylbiphenyl)-t-butylsulfonamide [prepared according to the procedure described in US patent 5126342] (4.2 g, 11 mMol). The mixture was stirred at 85°C for 12 h and then cooled to room temperature. The reaction was diluted with ethylacetate (100 mL), and the organic phase was washed with water (3 X 50 mL), and then dried over $MgSO_4$. The ethylacetate layer was filtered and concentrated in vacuo to a small volume (~10 mL). Dry ether (100 mL) was added and the precipitate formed was filtered and dried. The crude product was then recrystallized from hot ethylacetate to give the desired product 4-p-toluyl-2-(2'-t-butylaminosulfonyl)-biphen-4-yl)methyl-phthalazin-1-(2H)-one as white crystalline solid (4.3 g).
^{1}H-NMR ($CDCl_3$): δ 8.49 (m, 1H), 8.15 (d,1H), 7.76 (m, 3H), 7.15-7.60 (m,11 H), 5.50 (s, 2H), 3.51 (s, 1H), 2.45 (s, 3H), 0.91 (s, 9H).
FAB-MS: (m/e) 538 (M+H).

Step 2. 4-p-toluyl-2-(2'-aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one (Removal of the t-butyl group):

The solvent was removed in vacuo, and the residue was treated with cold aqueous saturated $NaHCO_3$. The precipitate formed was filtered and washed with water and then dried. The solid (2.4 g) was triturated with 50% ether in ethyl acetate (20 mL) at room temperature and

filtered to give the desired sulfonamide 4-p-toluyl-2-(2'-aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one as white amorphous solid (2.2 g).

ACYLATION OF SULFONAMIDE

4-p-toluyl-2-(2'-(6-(N-t-butoxycarbonyl)aminohexanoyl)-aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one.

To a solution of 6-(N-t-butoxycarbonyl)aminohexanoic acid (2.88 g, 12.45 mMol) in dry tetrahydrofuran (THF) (25 mL) was added carbonyl diimidazole (2.1 g, 12.45 mMol). The mixture was heated at 65°C for 3 h. After cooling to room temperature, a solution of the sulfonamide 4-p-toluyl-2-(2'-(6-(N-t-butoxy-carbonyl)amino-hexanoyl)aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one (obtained in Example 2) (2.0 g, 4.15 mMol) and 1,8-diazabicyclo-[5.4.0]undec-7-ene (DBU) (1.86 mL,12.45 mMol) in THF (20 mL) was added. The solution was stirred at 50°C for 18 hr. then concentrated to dryness *in vacuo*. 5% Citric acid solution was added and the mixture extracted with ethyl acetate three times.
